 /note= "Phosphorothioate backbone where all cytidines are 5-methyl cytidines"
                                                                                                       Jagged 1; serrate gene, JAG 1; HJ1; AGS; AHD; AMS; diagnosis; hyperproliferative disorder; developmental disorder; cytostatic; therapy; human; antisense; phosphorothioate backbone; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention is directed to antisense oligonucleotides targeted to jagged 1 (also known as serrate gene, JAG1, HJ1, AGS, AHD and AWS) and which modulate the expression of jagged 1. The invention is useful in diagnosing and treating hyperproliferative and developmental disorders. The invention acts as a cytostatic agent. The present sequence is human jagged 1 antisense oligonucleotide. This sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                New compound targeted to a nucleic acid molecule encoding jagged 1, useful in diagnosing and treating hyperproliferative disorder.
                                                                                                                                                                                                                                                     /mod_base= OTHER

The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided diagnosis of atherosclerosis, myocardial infartion, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

The sequences Annual of the present segments of industry sequences Annual standard is included in the invention for analysing a nucleic acid sample, which consists of the invention for analysing a nucleic acid sample, which consists of actermining the base occupying any one of the polymorphic sites given in the SNP containing sequences. The nucleotide sequences can be used in the diagnosis or monitoring of diseases, such as cancer, inflammation, heart diseases, diseases of the cardiovascular system, and infection by microorganisms. The oligonucleotides are also useful in the manufacture of a medicament for the treatment or prophylaxis of the diseases, and as a pharmaceutical. SNP containing oligonucleotides are useful in medicine such as phenotype correlation, forensics, paternity testing, medicine and genetic analysis DNA sequences AAH62100 - AAH62688 represent segments of human genes which New nucleic acid segments of the human genome, particularly from genes including polymorphic sites, for phenotype correlation, forensics, paternity testing, medicine and genetic analysis. Revised record issued on 09-SEP-2004 : Correction to Feature Table Key Single nucleotide polymorphism; SNP; human; cancer; inflammation; /*tag= a /standard_name= "single nucleotide polymorphism" 0.9%; Score 15.8; DB 1; Length 21; 89.5%; Pred. Plasmid vector of Rhodococcus for producing proteins such as enzymes involved in the removal of organic sulfur from fossil fuels, comprises a parA gene, genes encoding proteins involved in replication, and a genetic

Example 7; Page 8; 24pp; English.

The invention provides a cloning vector pSM843, comprising the rep genes ORF81 and trbA (encoding proteins involved in replication in Rhodococcus), the gene parA, and at least one gene which encodes a genetic marker (selected from the cad operon) that confers resistance to cadmuim or an antibiotic. The rep genes are useful for producing homologous or heterologous proteins of interest such as enzymes involved in the selective removal of organic sulfur from fossil fuels (SoxA, SoxB, SoxC), L-amino acids, enantiomorphs of chiral compounds and carboxylic acids in a microorganism. The proteins are preferably sox enzymes. Microorganisms such as Rhodococcus, Gordona and Nocardia containing the sox operon downstream to the constitutive promoter, in particular

. 0 Rhodococcus strain SMV114 CBS 102447, transformed with the vector are useful for removing organic sulfur from fossil fuels. The expression vector has high stability in the absence of selective pressure in the transformed strains of Rhodococcus. The present sequence represents a PCR primer used in the construction of the vector pSM847 Gaps antiarteriosclerotic; neuroprotective; nootropic; antiparkinsonian; anticonvulsant; pulmonary disease; restencosis; Alzheimer's; Parkinson's; epilepsy; dementia; huntingcon's; amyotrophic lateral sclerosis; gene therapy; target; ss; CDK2. .; Score 15.8; DB 1; Length 23; Pred. The invention relates to a double-stranded short interfering nucleic acid (siNA) molecule that down-regulates expression of an endogenous mammalian target gene comprising one or more chemical modifications and each strand of the double-stranded siNA comprises about 21 nucleotides. The siNA of New double-stranded short interfering nucleic acid molecule, useful for down-regulating the expression of an endogenous mammalian target gene or for treating diseases that respond to modulation of gene expression or the invention demonstrates antiarteriosclerotic, neuroprotective, nootropic, antiparkinsonian and anticonvulsant activities and may be useful for down-regulating the expression of an endogenous mammalian target gene and therefore in the treatment of any disease or condition that responds to modulation of gene expression or activity in a cell, tissue or organism. The disease or condition may include pulmonary Example 24; SEQ ID NO 30; 593pp; English. WPI; 2003-731676/69. activity.

The invention relates to human Myb protein 32 (AAM49156) and to nucleic acids encoding it (ABL55121). The protein has a molecular weight of 32 Kb. The invention also relates to a method for the recombinant production of the protein, an antagonist of the protein, and the use of the protein, gene and antagonist in therapeutic applications. Myb protein 32 can be used in the treatment of a variety of diseases such as cancer and HIV (human immunodeficiency virus) infection. Sequences ABL55122-ABL55123 represent reverse transcription-PCR (RT-PCR) primers used in an exemplification of the invention to isolate human Myb protein 32 cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Polypeptide-human Myb protein 32 and polynucleotide for coding it, useful for treating cancer, and HIV infection.
                                                                                                                                         Human, Myb protein 32; recombinant production; cancer; HIV infection; human immunodeficiency virus; gene therapy; cytostatic; anti-HIV; reverse transcription-PCR; RT-PCR; primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel polypeptide-human ribosomal protein S4-18.04 and polynucleotide for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to human ribosomal protein S4-18.04 (see ABB98784). The protein and its coding sequence can be used for treating several diseases, such as malignant tumours, haemopathy, HIV infection, immunological disease and various inflammations. The present sequence is a PCR primer, which was used in an example from the invention
diseases such as restenosis, atherosclerosis, Alzheimer's disease, barkinson's disease, epilepsy, dementia, huntington's disease, or amyotrophic lateral sclerosis. Furthermore, the siNA may be utilised for gene therapy applications. The current sequence is that of the siNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, ribosomal protein S4-18.04; tumour; haemopathy; HIV infection; immunological disease; inflammation; cytostatic; anti-HIV; PCR; primer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ô
                                                                                                                                                                                                   The present invention describes a method for preparing a cell population enriched for long-term repopulating human haematopoietic stem cells. The method comprises obtaining a population of cells from human haematopoletic tissue and isolating a population of KDR+ cells. KDR is a human vascular endothelial growth factor receptor (VEGFRII). The novel cell population can be used to inhibit rejection of a transplanted organ, by administering the KDR+ cells of the donor to a tissue recipient. The present sequence represents a reverse transcription PCR primer, which is

The invention relates to novel isolated G-protein coupled receptor (GPCR)

Complypeptides and polynucleotides. The GPCR polypeptide, GPCR nucleic acid
and antibody are useful for treating, preventing or alleviating a GPCR-
associated disorder or a pathological state in a subject, particularly a
company modulation. The GPCR polypeptide and nucleic acid are also useful
cor diagnosing the presence of or predisposition to a disease associated
cor diagnosing the presence of or predisposition to a disease associated
with altered levels of GPCR, particularly cancer. The GPCR nucleic acid
complications for disorders associated with aberrant GPCR expression or
activity. The DNA encoding the protein is useful in gene therapy for
creating the above conditions. Furthermore, the nucleic acids and
colypeptides are useful in treating adenocarcinoma, lymphoma, prostate
cancer, uterus cancer, immune response, neurodegenerative disorders,
cancer, uterus cancer, immune response, meurodegenerative disorders,
cancer, uterus cancer, immune response,
cancer also useful in developing a
concer, uterus cancer, immune response,
cancer also useful assay system for functional analysis of various human disorders,
as well as in diagnostic applications. ABS58747-ABS59231 represent human
concert.

A series of synthetic probes were tested for their ability to hybridise to specific bacterial species in the CSF. For the detection of streptococcus agalactiae probe KG00001 lacking 2 bases from the 5' end gives an improved detection rate. See also AAQ37314-60. (Updated on 25-
                                                                                                                                                                       A series of synthetic probes were tested for their ability to hybridise to specific bacterial species in the CSF. For the detection of Streptococcus agalactiae probe VP109 lacking 2 bases from the 5' end gives an improved detection rate. See also AAQ37314-59. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                  Detecting bacteria causing meningitis in cerebrospinal fluid - by amplifying target regions and detecting using panel of probes which includes universal bacterial probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detecting bacteria causing meningitis in cerebrospinal fluid - by amplifying target regions and detecting using panel of probes which

The method involves generating homoduplexes and heteroduplexes in a sample and performing gelectrophoresis on the sample using a polyacrylamide gel that causes comprises 3-20% polyacrylamide. 1-50% of at least one denaturing agent selected from alighatic alcohols, cyclic alcohols, alicyclic compounds, amides, ureas and carbamates, 10-100 mM borate-free TE [Tris-HG1, EDTA] buffer, and 10-100 mM taurine. The method has a high reliability and can be improved by allowing for the presence of the mutations in domains with high melting temperatures. These primers can specifically detect a

The present invention relates to diagnosing or monitoring transplant rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreaticistet, lung, bone marrow or stem cell transplant rejection, and individual. The method is also useful in assessing the immune status of an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid arthritis, lupus, inflammatory bowel diseases, multiple sclerosis, HIV/AIDS or viral, bacterial or fungal infection. The present sequence represents a Taqman probe for a 50 mer oligonucleotide marker for diagnosis and

Sequences AAH17205 - AAH40944 represent PCR primers, single nucleotide

CC primer extension (SNPE) primers, and the sequences of regions flanking

Sites of single nucleotide polyworphisms SNPs. The present invention

collodes kits for determining the presence or absence of a SNP, using the

includes kits for determining the presence or absence of a SNP, using the

collognucleotides are useful for genotyping a nucleic acid sample by

performing a single-nucleotide primer extension reaction. The

collognucleotides are useful for determining the presence, absence or

collognucleotides are useful for determining the presence, absence or

clantity of a SNP and for genotype of an individual or group of

collognucleotides are useful for determining the presence, absence or

identity of a SNP and for genotype of an individual or group of

collognucleotides are useful for determining the presence, absence or

collognucleotides are useful for determining the presence, absence or

collognucleotides are useful for determining the presence, absence or

collognucleotides are useful for determining the presence of being

caused by one or more SNPs. Phenotypic trait suspected of being

caused by one or more SNPs. Phenotypic traits include disease e.g.

caused by one or more SNPs. Phenotypic traits include disease

caused by one or more sNPs. Phenotypic traits and individual or group of

disease of which a component is or susceptibility to multifactorial

cdisease of which a component is or may be genetic such as autoimmune

cdiseases, including, rheumatoid arthritis, multiple sclerosis,

concer, and concer, nervous system diseases and infection by pathogenic

microorganism. The method is also useful in forensic investigations and

content to a numan SNP containing DNA sequence

contents a pergament sequence

contents and acute intervence represents a PCR primer specific

contents and acute intervence represents a PCR primer specific

                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to the isolation of polynucleotide sequences encoding at least one regulator of morphology and capable of regulating the morphology of a dimorphic fungal cell, and operably linked to a nucleotide sequence comprising an expression signal capable of directing the expression of the first sequence in a dimorphic fungal cell, where the sequences are not natively associated. The invention provides fungal host organisms capable of expressing recombinant proteins while at the same time exhibiting homogeneous growth and low viscosity characteristics. The fungal host organism has the capability for high protein secretion normally associated with filamentous fungi. The dimorphic fungal cells are useful for increasing production and/or secretion of large quantities of commercially valuable proteins. The present sequence represents a primer used in the examples of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Fruit fly; LRR47 polypeptide 47-33.88; embryonic development deformity; tumour; diabetes; menstrual disorder; peptide ulcer; arrhythmia; anaemia; epilepsy; reverse transcriptase PCR; RT-PCR; primer; ss.

The invention relates to an oligonucleotide array (1) comprising at least 25 different addresses (adapter sequences) with each comprising a different capture probe selected from a group consisting of the sequences given in ABQ00010-ABQ13409. (1) is useful for immobilising a target nucleic acid sequence by attaching a adapter nucleic acid (ABQ00010-

ABQ13409) to a target nucleic acid to form a modified target nucleic acid and contacting the modified target nucleic acid with (I). The steps of above method is useful for detecting a target nucleic acid, which further comprises detecting the presence of the modified target nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an oligonucleotide array (I) comprising at least 25 different addresses (adapter sequences) with each comprising a different capture probe selected from a group consisting of the sequences given in ABQ00010-ABQ13409. (I) is useful for immobilising a target nucleic acid sequence by attaching a adapter nucleic acid (ABQ00010-ABQ13409) to a target nucleic acid to form a modified target nucleic acid and contacting the modified target nucleic acid with (I). The steps of above method is useful for detecting a target nucleic acid, which further comprises detecting the presence of the modified target nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          comprising adapter sequences useful for immobilizing or detecting a t nucleic acid sequence, has different addresses comprising

25 different addresses (adapter sequences) with each comprising a different capture probe selected from a group consisting of the sequences given in ABQ00010-ABQ13409. (1) susful for immobilishing a target nucleic acid sequence by attaching a adapter nucleic acid (ABQ00010-ABQ13409) to a target nucleic acid to form a modified target nucleic acid and contacting the modified target nucleic acid above method is useful for detecting a target nucleic acid, which further comprises detecting the presence of the modified target nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                               Array comprising adapter sequences useful for immobilizing or detecting a target nucleic acid sequence, has different addresses comprising different specific capture probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an oligonucleotide array (I) comprising at least

The present invention describes a method (MI) for designing capture oligomuclectide probes (I) for use on a support to which complementary oligomuclectide probes (II) will hybridise with little mismatch, where coligomuclectide probes (II) will hybridise with little mismatch, where coligomuclectide probes (II) will hybridise with little mismatch, where coligomuclecting infectious diseases caused by bacterial infectious agents e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus neoforames, Candida albicans and Aspergillus funigatutus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and polio virus, and parasitic infectious agents e.g. Selected from Onchowerava volvulus, Entameba histolytica and Dracunculus comedinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.

CC selected from Onchowerava volvulus, Entameba histolytica and Dracunculus cirvolved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, p53 gene, human papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the popert at the particular sites and identifying if ligation of the oligomuclectide probe sets occurred and correlating (using a computer) identified ligation to a presence or absence of the target nucleotide sequences.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         the present interface a method (mil) to despining depoute oligonucleotide probes (I) for use on a support to which complementary oligonucleotide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents of Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal finectious agents e.g. Cryptococcus neoformans, Candida albicans and Appergillus fundautus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and polio virus, and parasitic infectious agents comedinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.

Concer is specifically associated with a gene selected from BRCA1 gene, cancer is specifically associated with a gene selected from BRCA1 gene, cancer is specifically associated with a gene selected from BRCA1 gene, method is also used for environmental monitoring, forensics and the food method is also used for environmental monitoring, forensics and the food cand feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the concurred and correlating (using elemental fightion to a series of the support at the concurred and correlating (using ecomprise and ingenized to a scanning and the food the support and compute of the oligonucleotide probe and correlating (using ecompanies and members and the food the support and contract of the concurred and correlating (using ecompanies and algernate of the concurred and correlating despinate and computed to a scanning and the food and correlating (using ecompanies and indicating order and ecomputed and correlating to a member and and correlating envisors and feed to a scanning and the food and correlating events and ecomputed and correlating envisors and feed to a scanning expected to a scanning expected to a scanning expected to a scanning expected to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           presence or absence of the target nucleotide sequences. ABI82074 to ABI97546 represent oligonucleotide sequences used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human, K-ras, PCR primer, probe, capture probe, mutation detection, ligase detection reaction, LDR, p53; BRCA1; BRCA2; infectious disease, infection; 21 hydroxylase deficiency; Turner Syndrome, obsity; cancer, oncogene; tumour suppressor; human papillomavirus; forensic; environmental monitoring; food industry; feed industry; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Designing capture oligonucleotide probes for use on a support to which complementary oligonucleotides hybridize with little mismatch.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The present invention describes a merica (Mi) for despining capture oligonucleotide probes (I) for use on a support to which complementary oligonucleotide probes (II) will hybridise with little mismatch, where (I) have meelting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. Cryptococcus neoformans, Candida albicans and Aspergillus funigatutus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and polio virus, and parasitic infectious agents e.g. Cryptococcus neoformans, Candida albicans and Aspergillus funigatutus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and polio virus, and parasitic infectious agents as 21 hydroxylase deficiency, Turner Syndrome and obesity defects. Detecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, cancer is specifically associated with a gene selected from BRCA1 gene, method is also used for environmental monitoring, forensics and the cancers. The method is also used for environmental monitoring (using e.g. a scanning electron microscope and infrared microscope) the support at the cancer and infrared microscope) the support at the particular sites and infrared microscope) the support at the particular sites and infrared microscope) the support at the particular sites and infrared microscope) the support at the particular sites and infrared microscope) the support at the particular sites and infrared microscope) the support at the particular sites and infrared microscope. Allestic of the particular sites and infrared microscope and particular gland (and the support at the particular sites and infrared microscope. Allestic of the particular sites and infrared microscope. Allestic of the particular sites and infrared microscope. Allestic of the particular sites and infrared microscope.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ABI97546 represent oligonucleotide sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                  Designing capture oligonucleotide probes for use on a support to which complementary oligonucleotides hybridize with little mismatch.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a method (M1) for designing capture

Capture oligonucleotide Zip ID#235 oligo #4. (first entry)

Human; K-ras; PCR primer; probe; capture probe; mutation detection; ligase detection reaction; LDR; p53; BRCAL; BRCAC; infectious disease; infection; 21 hydroxylase deficiency; Turner Syndrome; obesity; cancer; oncogene; tumour suppressor; human papillomavirus; forensic; environmental monitoring; food industry; feed industry; ss.

Synthetic.

```
Detecting cancer involving oncogenes, thunk suppressor genes, or cancer involving oncogenes, thunk suppressor genes, or cancer is specification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, p53 gene, human papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the particular sites and identifying if ligation of the oligonucleotide probe sets occurred and correlating (using a computer) identified ligation to a presence or absence of the target nucleotide sequences. ABI82074 to ABI97546 represent oligonucleotide sequences used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               oligonucleotide probes (1) for use on a support to which complementary oligonucleotide probes (1) will hybridise with little mismatch, where (1) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus neoformens, Candida albicans and Aspergillus funigaucus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and polio virus, and parasitic infectious agents selected from Onchoverva volvulus, Entamocba histolytica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.
                                                                                                                                                                                                                                                                                                                                                   Designing capture oligonucleotide probes for use on a support to which complementary oligonucleotides hybridize with little mismatch.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0;

The present invention describes a method (M1) for designing capture oligonucleotide probes (I) will hybridise with little mismatch, where coligonucleotide probes (II) will hybridise with little mismatch, where coligonucleotide probes (II) will hybridise with little mismatch, where coligonucleotide probes (II) will hybridise with little mismatch, where see of salmonella, listeria monocytogenes and Haemophilus influenza, fungal infectious agents or conformans, Candida albicans and conformans, virus and parasitic infectious agents or selected from Onchoverva volvulus, med parasitic infectious agents captered from Onchoverva volvulus, man parasitic infections agents or selected from Onchoverva volvulus, promered histolytica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such concert involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, cancer is specifically associated with a gene selected from BRCA1 gene, ps3 gene, human papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental montoring, forensics and the food and feetching comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the particular sites and identifying if ligation of the oligonucleotide probe sessor or absence of the target undercost sequences. ABL82074 to a presence or absence of the target undercost and the exemplification or a present oligonucleotide sequences used in the exemplification.
                                                                                                                                                                                                                                                                                                                                               Designing capture oligonucleotide probes for use on a support to which complementary oligonucleotides hybridize with little mismatch.
                                                                                                                                                                                                                                               Favis R, Kliman

The present invention describes a method (M1) for designing capture oligonuclectide probes (II) for use on a support to which complementary oligonuclectide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus neoforamas, Candida albicans and Aspergillus fumigautus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and polio virus, and parasitic infectious agents e.g. Eslected from Onchoverva volvulus, Entamoeba histolyfica and Dracunclus captured from Onchoverva volvulus, Entamoeba histolyfica and Dracunclus as 1 hydroxylase deficiency, Turner Syndrome and obesity defects.

CC medinesis. The method is also useful for detecting genetic diseases such as 1 hydroxylase deficiency, Turner Syndrome and obesity defects.

CC petecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from ERCA1 gene, p53 gene, human papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the cc particular sites and identifying if ligation of the oligonucleotide probe sets occurred and correlating (using a computer) identified ligation to a presence or absence of the target nucleotide sequences. The invention relates to a novel composition comprising a sustained culture of chicken embryonic stem (ES) cells with a transgene stably integrated into the genome of substantially all of the progeny of the ES cells, which contribute to B lymphocytes of a chimeric chicken produced by the injection of the ES cell progeny into a chicken embryo. The composition of the invention may be useful for preparing human polyclonal antibodies for human therapy. The current sequence is that of the PCR primer 1 of the invention which was used to amplify human immunoglobulin heavy chain VH4-4 region.

New isolated nucleic acid molecule comprising a part of the sequence of intron 1 of a human LY-6 superfamily gene or of a homologous gene from an animal, useful for preparing a medicament to regulate gene expression in subjects

Example 3; Page 38; 59pp; English

```
ö
         The invention relates to an isolated nucleic acid molecule comprising at least part of the sequence of intron 1 of a human LY-6 superfamily gene or of a homologous gene from an animal, or a corresponding sequence. The sequence comprises at least part of intron 1 of a gene selected from all LY-6 genes, CD59, uPAR, SP10, SLURP-I, E48, RIG-E, PSCA, ThB and TSA-LY-6xa2. The nucleic acid molecule is useful in preparing a medicament to regulate the expression of a gene in a subject. Sequences AD103768-AD103810 represent primers used in cDNA analysis of human and mouse MHC class III region LY-6 superfamily members (LY6G6C, LY6G6D, LY6G6E, LY6G5C)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; hammerhead ribozyme; cytostatic; antitumour; antidiabetic; ophthalmological; antiarthritic; antipsoriatic; virucide; osteopathic; vulnerary; cancer; lymphoma; Ewing's sarcoma; melanoma; psoriasis; tumour angiogenesis; diabetic retinopathy; macular degeneration; neovascular glaucoma; myopic degeneration; arthritis; verruca vulgaris; angiofibroma of tuberous sclerosis; port-wine stain; wound healing; sturge Weber syndrome; Kippel-Trenaunay-Weber syndrome; leukaemia; ss; Osler-Weber-rendu syndrome, leukaemia; osteoporosis; DNAzyme; inozyme;

Claim 4; Page 124; 149pp; English

The invention relates to a nucleic acid molecule (1) which down regulates expression of an Ets-related gene (ERG). (1) is useful for treating conditions selected from cancer, lymphoma, Bwing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, neovascular glaucoma, myopic degeneration, arthritis, psoriasis, veruca vulgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-rendu

cc treating a patient having a condition associated with the level of ERG, treating a patient having a condition associated with the level of ERG, by contracting cells of the patient with (1) under conditions suitable for the treatment. The method comprises the use of one or more therapies conder conditions suitable for the treatment. Leukaemia or tumour conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (1) is useful for reducing ERG activity in a cell, by contacting (1) with RNA, in the presence of a divalent cation such as Ng2+. (1) is useful for diagnosis of conditions and cation such as Ng2+. (1) is useful for diagnosis of conditions and cataon such as Ng2+. (1) is useful for grangestic tool to cataon such as hare homedogy within diseased cells or to detect the presence of ERG RNA in a cell. (1) is useful for specifically caramine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (1) is useful for specifically caramine genes that share homology with ERG gene or ERG funion genes. New isolated nucleic acid encoding an isoform of human pregnancy associated plasma protein E, for preventing or aborting pregnancy

Example 2; Page 146; 353pp; English

This invention describes a novel isolated nucleic acid that encodes one of three new isoforms of human pregnancy associated plasma protein E, hPAPP-E. The products of the invention have abortive and contraceptive activity and can be used for gene therapy or in a vaccine. The nucleic acid, polypeptide encoded by it, or antibody to the polypeptide can be used in pharmaceutical compositions or vaccines for preventing or aborting pregnancy. PAPP-E is used in the antenatal diagnosis of

dysgenetic pregnancies. The nucleic acids are used as probes to assess the level of PAPP-E isoform mRNA in chorionic villus samples, and the antibodies can be used to assess the expression levels of PAPP-E isoform proteins in chorionic villus samples, to diagnose dysgenetic pregnancies antenatally. This sequence represents an oligomer used in scanning the human PAPP-E genes described in the disclosure of the invention

Claim 4; Page 96; 152pp; English.

The invention relates to enzymatic nucleic acid molecules that down regulate expression of chloride channel calcium activated 1 (CLCA1) genes by cleaving RNA derived from the genes. The nucleic acid sequences are useful as pharmaceutical agents for treating conditions such as chronic obstructive pulmonary disease (COPD), chronic bronchitis, asthma, cystic fibrosis, obstructive bowel syndrome and any other diseases or conditions that are related to or will respond to the levels of CLCA1 in a cell or tissue. The sequences are useful for reducing CLCA1 activity in a cell, hence, are useful for treatment of a patient having a condition associated with the level of CLCA1, where the invention further comprises the use of one or more therapies under conditions suitable for the treatment, for example, oxygen therapy, bronchodilators, corticosteroids, antibacterials, vaccinations, acetylcysteine and mucokinetic agents. The nucleic acids of the invention are also used as diagnostic tools to

The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, inverted to a condition related to while it is neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least the 2'-O-methyl modifications, phosphorothicate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic molety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New nucleic acid molecule that modulates replication of West Nile Virus
examine genetic drift and mutations within diseased cells or to detect the presence of CLCA1 RNA in a cell. This sequence represents an enzymatic nucleic acid molecule of the invention
                                                                                                                                                          Gaps

The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, wrocarditis, meningits, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of mammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least three of the 5' terminal nuclectides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules Egg ID NO 1 to 37080 are claimed, however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligomucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip; in virco as (auti) sense reagents; and (2) for production of recombinant polypeptides. The oligomucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Interleukin-1 beta converting enzyme; ICB; protease; apoptosis; induction; inflammation; autoimmune disease; neurodegeneration; cancer; infection; treatment; Ty protein; polymerase chain reaction;

The present sequence is that of a PCR primer used for isolating the 3'-end of a cDNA sequence coding for the human protease designated Ty which is related to the interleukin-1 beta converting enzyme (ICE) and which induces apoptosis. The Ty protein has over 70% homology to Tx which converts the p30 precursor of ICE into 20 kD and 10 kD fragments and can be used for treating diseases which respond to ICE, e.g. inflammation. The ability to induce apoptosis will be useful for treating cancer

nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, defermatological, vycostatic, antisebortheic, antidabetic, antisickling, ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell cardinoma and viral or sebortheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vireoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn scar.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, ribozyme therapy, hairpin ribozyme, hammerhead ribozyme; recognition site; target, ribozyme binding site; eye disease; vulnerary, proliferative disease; skin disease; psoriasis; diabetic retinopathy; cytokine; inflammation; cell-cycle dependent kinase; cyclin; MMP; matrix metalloproteinase; growth factor; reductase; scarring; cytostatic; dermatological; antiseborrheic; antidiabetic; virucide; antisickling; ophthalmological; keratolytic; gene therapy; viral wart; atopic dermatitis; actinic keratolstic; squamous cell carcinoma; seborrheic wart; vitreoretinopathy; scar;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.
                                                                                                                                                                   The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.
Representative examples of ribozyme recognition sites are given in AAA88415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (1) which cleaves RNA encoding a cytchine involved in lifiammation, matrix metalloproteinase (MMP), cyclin, call-cycle dependent kinase, growth factor or a reductase, or administering a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cell-cycle dependent kinase cdk3 ribozyme binding site SEQ ID NO:308.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .;

that downregulates expression of a mitogen-activated protein kinase (MAPK) genes by RNA interference. Also described: (1) a method for modulating expression of MAPK genes in cells, tissue explants or organisms by introduction of siNA; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; and (4) conjugates and/or containing these vectors. MAPK siNAs car be used to modulate the expression of MAPK genes, in cells, clissue explants or organisms, e.g. for treating obesity; diabetes types I conjugate explants or organisms, e.g. for treating obesity; diabetes types I conjugate shock, rheumatoid arthritis, psoriasis and inflammatory because the conjugates and inflammatory dispenses. The transfer of clentification and validation; generic engineering; diagnosis; target conjugate the mapping (e.g. of single-nucleotide conjugated by the present sequence represents a MAPK sinA which is used in the examplification of the present sequence represents a MAPK sinA which is used in the example fication of the present sequence represents a MAPK sinA which is used in the example fication of the present sequence represents a MAPK sinA which is used in the example fication of the present sequence represents and present sequence.
present invention describes a short interfering nucleic acid (siNA)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                the exemplification of the present invention.

New short interfering nucleic acid, useful e.g. for treatment and

The present invention describes a short interfering nucleic acid (siNA) that downregulates expression of a mitogen-activated protein kinase that downregulates expression of a mitogen-activated protein kinase codulating expression of MAPK genes in cells, tissue explants or corganisms by introduction of siNA; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; and (4) cerops that express siNA and cells containing these vectors. MAPK siNAs corposatatic, anorectic, antibabetic, antibacterial, antirheumatic, antipaoriatic and gastrointestinal activities. The MAPK siNAs can be used to modulate the expression of MAPK genes, in cells, tissue explants or organisms, e.g. for treating obssity; diabetes types I cell and II; a wide range of tumours, and inflammatory diasease (asthma, septic shock, rheumatoid arthritis, psoriasis and inflammatory bowel cell disease). They can also be used for drug screening; diagnosis; target diseases. They can also be used for drug screening; diagnosis; target intentification and validation; genetic engineering; pharmacogenomics; cudentification of the present invention. ö Gaps downregulates expression of mitogen-activated ; 0 Score 15.4; DB 1; Length 19; Pred.                                                                                                                                                                                                                                                                                                ö
                                                                                    The invention relates to a novel double-stranded short interfering nucleic acid (siNA) that downregulates expression of the breakpoint cluster region—val Abelson murine leukaemia viral oncogene homologue 1 (BCR-ABL) gene. The siRNA of the invention demonstrates cytostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering, gene function studies and gene mapping. The current sequence is that of the human ERG2 (v-ets erythroblastosis virus B26 oncogene like (avian))—targeted siRNA of the invention.
                     New double-stranded interfering nucleic acid, useful e.g. for treatment and diagnosis of leukemia and lymphoma, downregulates the breakpoint cluster region-Abelson (BCR-ABL) gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New double-stranded interfering nucleic acid, useful e.g. for treatment and diagnosis of leukemia and lymphoma, downregulates the breakpoint cluster region-Abelson (BCR-ABL) gene.

                                                                                           nucleic acid (siNA) that downregulates expression of the breakpoint cluster region-v-abl Abelson murine leukaemia viral oncogene homologue 1 (BCR-ABL) gene. The siRNA of the invention demonstrates expressatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering, gene function studies and gene mapping. The current sequence is that of targeted siRNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cytostatic; vasotropic; nephrotropic; cerebroprotective; treating leukaemia; solid tumors; restenosis; polycystic kidney disease; bronchiolitis; glomerulonephritis; stroke; RNA interference; short interfering nucleic acid; siNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; micro-RNA; short hairpin RNA; shRNA; expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; human; platelet derived growth factor receptor; PDGFr; ss.

downregulate expression of the human platelet-derived growth factor receptor (PDGFr) gene by RNA interference. The sinAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the sinAs include short interfering RNA (siRNA, double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain (expressed from a cector or enzymatically synthesised, the invention also relates to kits for the in vitro or in vivo delivery of siRNA, conjugates and/or complexes of siRNA; and vectors that express siNA. The siNAs are used to modified expression of the pDGFr gene in cells, tissue explants or coganisms (e.g., by ex vivo gene therapy), or in grafts and transplants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants or creating leukaemia and solid tumours, restenosis, polycystic (sidney disease, bronchiolitis, glomerulomephritis and stroke. The siMNs are also the present sequence represents the lower strand of a human PDGFr transcript
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cytostatic; vasotropic; nephrotropic; cerebroprotective; treating leukaemia; solid tumors; restenosis; polycystic kidney disease; bronchiolitis; glomerulonephritis; stroke; RNA interference; short interfering RNA; since double-stranded RNA; micro-RNA; micro-RNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; short hairpin RNA; shRNA; therapeutic target identification; pharmacogenomics; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; human; platelet derived growth factor receptor; PDGFr; ss.

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the human platelet-derived growth factor creceptor (PDGFY) gene by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and may be double or single stranded. They comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA, double-cs tranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain decoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siRNA, conjugates and/or complexes of siRNA, and vectors that express siNA. The siNAs are used to complexes of siRNA, and vectors that express siNA, the siNAs are used to organisms (e.g., by ex vivo gene therapy), or in grafts and transplants of treating leukaemia and solid tumours, restenosis, tissue explants or treating leukaemia and solid tumours, restenosis, polycystic kidney classes, bronchiolitis, glomerulomephritis and stroke. The siNAs are also cuseful for drug screening, diagnosis, therapeutic target identification and variety organismes (e.g., by ex vivo gene therapy), or in grafts and transplants of stroke. The sinka are also creating, diagnosis, therapeutic target identification converted double-stranded siNA, which is identical to the PDGFr transcript
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Genetic proximity, gene expression; cell characterisation; homeobox gene; genetic defect; reverse transcriptase polymerase chain reaction; RT-PCR; kinase gene; protein phosphatase; P450; steroid receptor; cadherin;

The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and a second cell comprises: a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell the pattern of expression of genes in a selected gene family; and (c) calculating a proximity index using a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its genetic status, whether it carries a genetic defect, or whether it is can individual, e.g. a fetus. They can also be used for detecting a selected genetic defect in an individual, e.g. a fetus. They can also be used for detecting a containing the coftaining cells capable of expressing an homeobox related desired property. The method uses reverse transcriptase polymerase chain reaction (RT-PCR) for determining the pattern of gene expression in a selected gene family. Sequences AAZ17803-Z18342 represent primers that can be used in the RT-PCR reactions to determine the pattern of gene expression. The gene family can be selected from a set of homeobox genes, kinase genes, protein phosphatase genes, P450 enzyme genes, steroid receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; NOVX; cytostatic; cardiant; antinflammatory; immunosuppressive; antiallergic; haemostatic; anti-HIV; antidiabetic; antiarteriosclerotic; antorectic; antiasthmatic; nephrotropic; antiarthritic; hepatotropic; neuroprotective; nootropic; antibacterial; virucide; antiparasitic; relaxant; anticonvulsant; hypoteneive; vasotropic; antiparkinsonian; vulnerary; angiogenic; antiangiogenic; gene therapy; vaccine; cancer; cardiomyopathy; atherosclerosis; hypertension; diabetes; inflammation; autoimmuno disorder; allergy; hod disorder; AIDS; obesity; asthma; acquired immunodeficiency syndrome; nephropathy; cirrhosis; arthritis; Alzheimer's disease; Parkinson's disease; goitre; infection; stroke;
                                                                                                                                                           Identifying and characterizing cells by comparing the pattern of gene expression in a selected gene family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ACF03547 to ACF03570 encode the human NOVX proteins (I) given in ABR57412 to ABR57435. (I) have cytostatic, cardiant, antiinflammatory, nootropic, ammunosuppressive, antialergic, harmasthatic, antiinflammatory, nootropic, antiarteriosclerotic, anorectic, anisathmatic, nephrotropic, virucide, antiarthritic, hepatotropic, neuroprotective, antibacterial, relaxant, antiparasitic, anticonvulsant, hypotensive, vasotropic, antiparkfinsonian, vulnerary, angiogenic and antiangiogenic activities, and can be used in gene therapy and vaccines. The NOVX polypeptides and their antibodies can be used to determine the presence or absence of (I) in a sample. The NOVX polypeptides, polymucleotides encoding them, and antibodies against them, are useful in manufacturing a medicament for treating or preventing a syndrome associated with a NOVX-associated disorder such as hypertension,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cardiomyopathy, atherosclerosis, cancer, diabetes, asthma, inflammation, autoimmune disorders, alergies, blood disorders, obesity, acquired immunodeficiency syndrome (ALDS), immunoglobulin (Ig)A nephropathy, cirrhosis, arthritis, Alzheimer's disease, Parkinson's disease, goitre, infections (e.g. bacterial, viral, parasitic), stroke, muscular dystrophy, epilepsy, and other wasting disorders associated with chronic diseases. ACF03571 to ACF03644 represent PCR primers and probes for NOVX sequence, which are used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              disorders, e.g. cancer, cardiomyopathy, atherosclerosis or diabetes, and
in chromosome mapping, tissue typing or pharmacogenomics.

The invention is useful for inhibiting the expression of ATM in cells or tissues. The invention is useful for treating an animal with hyperproliferative or autoimmune disorder. The invention is useful for diagnostics, therapeutics, prophylaxis, as research reagents and kits, for distinguishing functions of various members of a biological pathway and in antisense gene therapy. The invention is also useful prophylactically e.g., to prevent to relay infection, inflammation or tumour formaction. The present sequence is an antisense oligo targetted to human ABC transporter MHC I DNA. This sequence is used to illustrate the method of
                                                                                                                                                                                                                                                                                                                                                             New antisense compound that hybridizes and inhibits the nucleic acid encoding ABC transporter major histocompatibility complex 1, for treating diseases or conditions such as a hyperproliferative or autoimmune

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              the DNA and protein sequences disclosed may prove useful for gene therapy. The protein, nucleic acid or antibody is useful for preparing a composition for treating or preventing a MOLX-associated disorder, for example cardiomyopathy, diabetes or atherosclerosis. The present sequence is that of a human PCR primer which was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention relates to novel human nucleic acid sequences which encode
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          novel molecule (MOL) proteins numbered MOL1-23, referred to generally in the specification as MOLX. Compounds which modulate the function of the MOLX proteins of the invention, MOLX agonists or antagonists, may have cardiant, antidiabetic or antiarteriosclerotic activities. In addition,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New MOLX polypeptide, nucleic acid or MOLX-specific antibody, useful preparing a composition for treating or preventing a MOLX-associated disorder, e.g., cardiomyopathy, diabetes or atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The present invention relates to a method for the direct comparison of numerical gene expression values between samples of genes. The method comprises amplifying cDNA in the presence of a compeditive template mixture and primer pairs for several genes and then amplifying aliquots of the PCR products using a primer pair specific for each gene. The method of amplification is by multiplex standardised reverse transcriptase-polymerase chain reaction (Starr-PCR). High density oligonucleotide or cDNA arrays are used to measure PCR products following quantitative Starr-PCR. The method is useful for the assessment of gene expression in small biological samples such as fine needle aspirate biopsies, and laser captured microdissected materials. The method allows for the standardised measurement of hundreds of genes from the same cample, which in prior art, could only be assessed for one gene. The present sequence represents a multiplex StaRT-PCR primer which can be used in the method of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Direct comparison of numerical gene expression values between samples of genes comprises using multiplex standardized reverse transcription-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           proliferation; cancer; cancer cell growth inhibition; human; PCR primer;
                                                Gene expression; multiplex standardised reverse transcriptase-PCR; StaRT-PCR; high density oligonucleotide array; cDNA array; small biological sample; fine needle aspirate biopsy; laser captured microdissected material; human; primer; ss.
               Human gene expression analysis multiplex StaRT-PCR primer #229.

The present invention describes a method for determining whether an agent can be used to reduce the proliferation and/or cause the death of cancer cells or inhibit the growth of a cancer cell population. The method is useful in determining whether an agent can be used to reduce the proliferation and/or cause the death of cancer cells or inhibit the growth of a cancer cell population. The present sequence represents a PCR primer which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                      Determining whether an agent can be used to reduce the proliferation, cause the death or inhibit the growth of cancer cell population by obtaining a sample of cancer cells and quantifying the level of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     NOVX; antidiabetic; anorectic; cardiant; hypotensive; antidiabetic; anorectic; virucide; antibacterial; fungicide; protozoacide; nootropic; neuroprotective; antiparkinsonian; anticonvulsant; noteopathic; antiarthritic; antidiaflammatory; dermatological; antiasthmatic; antilipaemic; metabolic; diabetes; obesity; infection; anorexia; cancer; cardiovascular; hypertension; atherosclerosis; neurodegenerative; Alzheimer's disease; Parkinson's; epilepsy; immune; osteoarthritis; haemopoietic; inflammatory skin disorder; asthma; dyslipidaemia; neurogenesis; cell differentiation; proliferation; haemopoiesis; wound healing; angiogenesis; gene therapy; chromosome mapping; tissue typing;

The invention relates to a novel isolated NOVX polypeptide. The cardiant, hyportensive, antiatteriosclerotic, anorectic, virucide, antibatteriosclerotic, anorectic, virucide, antibatteriosclerotic, oncropic, neuroprotective, antibatteriola, fungicide, protozoacide, nootropic, neuroprotective, antibatteriorial, fungicide, protozoacide, nootropic, neuroprotective, antibatkinsonian, anticonvulsant, osteopathic, antiarthritic, antiarthritic, antiarthritic, antiarthritic, antiarthritic, antiarthritic, antiarthritic, and protozoal, antiarthritic, and antibodies may be useful in the manufacture of a medicament for treating metabolic consorders, diabetes, obesity, infectious diseases (viral, bacterial, fungal, helminthic, and protozoal), anorexia, cancer, cardiovascular cdiseases including hypertension and atherosclerosis, neurodegenerative disorders such as osteoarthritis, haemopolatic disorders, infanmatory skin disorders asthma and various types of dyslipidaemis. The nucleic acids and polypeptides may also be used as targets for the identification of small molecules that modulate or inhibit neurogenesis, consideration, cell proliferation, hemopoiesis, wound healing and and and antipodies that modulate or inhibit meurogenesis, in gene therapy and the in generation of antibodies that bind immunospecifically to NoVX substances for use in therapeutic or diagnostic methods. The nucleic acids may be further used as the human end pharmacogenemics. The current sequence is that of the human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 medicine and pharmacogenomics. The current sequence is that of the hv
NOVX-related PCR primer which was used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated NOVX polypeptide, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease, asthma, or infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Alvarez E, Anderson DW, Boldog FL, Catterton E, Edinger SR; Fernandes ER, Gerlach VL, Gorman L, Grosse WM, Guo X, Ji W; Kekuda R, Li L, Macdougall JR, Padigaru M, Patturajan M; Peterson JD, Rastelli L, Shimkets RA, Spytek KA, Stone DJ; Vernet CAM, Voss EZ, Zhong M;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              invention
```

```
The present invention relates to antisense compounds targeted to a nucleic acid encoding beta-site APP-cleaving enzyme 2. The antisense compound comprises an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits the expression of beta-site APP-cleaving enzyme 2. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense oligonucleotide comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-0-comprises at least one modified nucleobase, preferably a 5'-0-comprises at least one modified nucleobase, preferably a 5'-0-comprises at least one shippincolocides are useful for the reatment of diseases such as hyperproliferative disorders, e.g. cancer, and neurodegenerative disorders such as Alzheimer's disease. The present sequence represents an antisense oligonucleotide used in the examples of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding beta-site APP-cleaving enzyme 2 useful for treating a disease or condition, e.g. cancer, Alzheimer's disease or
                                                                                                                                                                                                                                                                                                                                                                      "tdd base= OTHER /mcd base a phosphorothioate /mcd base= "This oligonucleotide has a phosphorothioate backbone and 2'-methyoxyethyl (2'-MCB) wings at the 5' and 3' ends, which are 5 nucleotides in length at each end. All cytidine residues are 5-methylcytidines"
                                                                                                                                                Human beta-site APP-cleaving enzyme 2, antisense oligonucleotide #10.
                                                                                                                                                                                  Antisense therapy, human; beta-site APP-cleaving enzyme 2; hyperproliferative disorder; cancer, neurodegenerative disorder; Alzheimer's disease; cytostatic; neuroprotective; nootropic; phosphorothioate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 20 BP; 6 A; 5 C; 4 G; 5 T; 0 U; 0 Other;

The present invention relates to antisense compounds targeted to a nucleic acid encoding beta-site APP-cleaving enzyme 2. The antisense compound comprises an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits the expression of beta-site APP-cleaving enzyme 2. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense oligonucleotide comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar moiety, preferably a 2-0-comprises at least one modified nucleobase, preferably a 5-0-comprises at least one modified nucleobase, preferably a 5-comprises at least one modified nucleobase, preferably a 5-comprise methylcytosine. The antisense oligonucleotides are useful for the creatment of diseases such as hyperproliferative disorders, e.g. cancer, and neurodegenerative disorders such as Alzheimer's disease. The present sequence for an antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New compounds, particularly antisense oligonucleotides targeted to a mucleic acid encoding beta-site APP-cleaving enzyme 2 useful for treating a disease or condition, e.g. cancer, Alzheimer's disease or neurodegenerative disease.
                                                                                                                                                                                                                                                                                                                Antisense therapy, human; beta-site APP-cleaving enzyme 2; hyperproliferative disorder; cancer; neurodegenerative disorder; Alzheimer's disease; cytostatic; neuroprotective; nootropic; ds.
                                                                                                                                                                                                                                                                          Human beta-site APP-cleaving enzyme 2 DNA target sequence #9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0.9%; Score 15.4; DB 1; Length 20;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ò
```

```
The invention relates to a compound comprising a sequence comprising 8-80 base pairs (bp) targeted to a nucleic acid encoding protein tyrosine phosphatase type 1VA member 3 (PRL-3), that specifically hybridises with the nucleic acid encoding PRL-3 and inhibits expression of PRL-3, i.e. is an antisense oligonucleotide (AO). Also included are a composition comprising the compound and a carrier or diluent, inhibiting the expression of PRL-3 in cells or tissues, treating an animal having or suspected of having a disease or condition associated with PRL-3 and screening for an antisense compound. The antisense oligonucleotide is useful for preparing a composition for treating hyperproliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New antisense oligonucleotide, comprising a sequence targeted to a nuclaic acid encoding protein tyrosine phosphatase type IVA member 3 (PRL -3), useful for preparing a composition for treating hyperproliferative disorders, e.g., cancer.
                                                                                                                                                                                                                                                                  /mod_base= OTHER

```
The invention relates to a compound comprising a sequence comprising 8-80 base pairs (bp) targeted to a nucleic acid encoding MARK3 (MAP) microtubule affinity-regulating kinase 3), that specifically of MARK3, i.e. is an antisense oligonucleotide (AO). Also included are a composition comprising the compound and a carrier or dilumer, inhibiting the expression of MARK3 in cells or tissues, treating an animal having or suspected of having a disease or condition associated with MARK3 and screening for an antisense compound. The antisense oligonucleotide is useful for preparing a composition for treating hyperproliferative diseases. Partier and neurodegenerative diseases e.g. Alzheimer's diseases. The present sequence is a MARK3 cDNA target region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antisense compound targeted to a nucleic acid molecule encoding microtubule-affinity-regulating kinases (MARK3), useful for modulating expression of MARK3 or for treating cancer or Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antisense oligonucleotide targeting human MARK3 ISIS 151469.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0.9%; Score 15.4; DB 1; Length 20; 94.1%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a compound comprising a sequence comprising 8-80 base pairs (bp) targeted to a nucleic acid encoding protein tyrosine phosphatase type IVA member 3 (PRL-3), that specifically hybridises with the nucleic acid encoding PRL-3 and inhibits expression of PRL-3, i.e. is an antisense oligonucleotide (AO). Also included are a composition comprising the compound and a carrier or diluent, inhibiting the expression of PRL-3 in cells or tissues, treating an animal having or suspected of having a disease or condition associated with PRL-3 and screening for an antisense compound. The antisense oligonucleotide is useful for preparing a composition for treating hyperproliferative disorder, particularly cancer (Gog. colorectal cancer), diabetes, reduced glucose tolerance, insulin resistance and obesity. The present sequence is a Human PRL3 cDNA AO target region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antisense oligonucleotide, comprising a sequence targeted to a nucleic acid encoding protein tyrosine phosphatase type IVA member 3 (PRL -3), useful for preparing a composition for treating hyperproliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The invention relates to a compound comprising a sequence comprising 8-80 base pairs (bp) targeted to a nucleic acid encoding MARK3 (MAP/microtubule affinity-regulating kinase 3). that specifically hybridises with the nucleic acid encoding MARK3 and inhibits expression of MARK3, i.e. is an antisense oligonucleotide (AO). Also included are a composition comprising the compound and a carrier or diluter, inhibiting the expression of MARK3 in cells or tissues, treating an animal having or suspected of having a disease or condition associated with MARK3 and screening for an antisense compound. The antisense oligonucleotide is useful for preparing a composition for treating hyperproliferative disorder, particularly cancer and neurodegenerative diseases e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; ss; antisense gene therapy; protein phosphatase 2A A subunit;

The invention relates to a compound 8-80 mucleobases in length targeted to, and which specifically hybridises with a nucleic acid molecule encoding PPPRARA (protein phosphatase 2A A subunit), and inhibits the expression of PPPRARA (protein phosphatase 2A A subunit), and inhibits the expression of PPPRARA, i.e. is an antisense oligonucleotide (AS). Also included are a compound 8-80 nucleobases in length that specifically by hybridises with at least an 8-nucleobase portion of an active site on a nucleic acid molecule encoding PPPRARA, a composition comprising the compound and a carrier or diluent, inhibiting the expression of PPPRARA in compound and a carrier or diluent, inhibiting the expression of PPPRARA is inhibited), treating an animal having a disease or condition associated with PPPRARA (by administering to the expression of PPPRARA is inhibited), treating an antisense compound (comprising to prophylactic amount of the compound so that a compression of PPPRARA with one or more candidate antisense compounds that inhibit the expression of a nucleic acid encoding compound, composition and methods are useful for treating a disease or condition associated with PPPRARA, such as a neurodegenerative disorder, a hyperproliferative disorder, as uncleased or condition arising from aberrant apoptosis, viral or parasitic infection. They are also useful in research and diagnostics for modulating the compound of an encoding in services or condition arising the encoding is an encoding the component of an antisense compound of an arising the encoding condition arising from a person and secondate or an encoding condition arising from a person and secondates. A such as a neurodegenerative condition arising from a person and secondates or condition arising from a person and secondates. A such as a neurodegenerative condition arising from a person and secondates. A such as a neurodegenerative condition arising from a person and secondates or condition arising from a person and secondates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding forkhead box OlA, where the compound is at least 70% complementary to a nucleic acid molecule encoding forkhead box OlA and modulates expression of forkhead box OlA by at least 10%. The compound is useful for treating an animal having a disease or condition associated with forkhead box OlA, e.g. a hyperproliferative disorder (cancer, preferably rhabdomyosarcoma), or type 2 diabetes. This sequence corresponds to a targeted sequence from the human foxhead box
                                                                                                                                          ss; cytostatic; antidiabetic; foxhead box OIA inhibitor; forkhead box OIA; hyperproliferative disorder; cancer; rhabdomyosarcoma; diabetes; H-ras gene; antisense; gene expression; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                             The invention relates to a compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding forkhead box OIA, where the compound is at least 70% complementary to a nucleic acid molecule encoding forkhead box OIA and modulates expression of forkhead box OIA by at least 10%. The compound is useful for treating an animal having a disease or condition associated with forkhead box OIA, e.g. a hyperproliferative disorder (cancer, preferably rhabdomyosarcoma), or type 2 diabetes. This sequence corresponds to an oligonucleotide targeted to the human foxhead box OIA genes in order to inhibit gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Farnesoid X receptor gene expression antisense inhibitory oligo #2097.

                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an antisense compound 8-30 nucleobases in length targeted to a nucleic acid molecule encoding Farnesoid X receptor (FXR), where the antisense compound specifically hybridizes with and inhibits the expression of FXR. The composition and methods are useful for inhibiting the expression of FXR (Farnesoid X receptor) in cells or tissues, or for treating diseases or conditions associated with FXR, such as diabetes, immunological disorders, cardiovascular disorders, e.g. dyslipidemia and its symptoms, atheroselerosis, low HDL (high density lipoprotein) elevated LDL (low density lipoprotein) or hypertholesterolemia, gallstones, hypertriglyceridemia, obesity. In addition, the composition is used for diagnostics, prophylaxis, or as research reagents or kits. This sequence corresponds to an antisense oligonucleotide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

```
The invention relates to an antisense compound 8-30 nucleobases in length targeted to a nucleic acid molecule encoding Farnesoid X receptor (FXR), where the antisense compound specifically hybridizes with and inhibits the expression of FXR. The composition and methods are useful for inhibiting the expression of FXR (Farnesoid X receptor) in cells or tissues, or for treating diseases or conditions associated with FXR, such dyslipidemia and its symptoms, atheroscierosis, low HDL (high density lipoprotein), elevated LDL (low density lipoprotein) or hypercholesterolemia, gallstones, hypertiiglyceridemia, obesity, neueurological disorders, or ischemia/reperfusion injury. In addition, the composition is used for diagnostics, prophylaxis, or as research reagents or whits. This sequence corresponds to an antisense oligonucleotide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antisense oligonucleotides useful for modulating expression of Farnesoid X Receptor (FXR) or for treating diseases associated with FXR, e.g. diabetes, immunological disorders, cardiovascular disorders, gallstones or obesity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; PIM-1; ss; antisense oligonucleotide; phosphorothioate linkage;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
gallstones; hypertriglyceridemia; obesity; neurological disorder;

```
The invention relates to a compound targeted to a nucleic acid molecule encoding the human PIM-1 polypeptide. The compound is an antisense obligonucleotide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothicate linkage, at least one modified sugar moiety, preferably as 2'-0-methoxyethyl sugar moiet, or at least one modified nucleobase comprising a 5-methyloytosine. The antisense compounds are useful for modulating the expression of the human PIM-1 polypeptide and in preparation of a composition for treating hyperproliferative disorders, e.g. cancer. This sequence repersents a human PIM-1 DNA antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, forkhead box OlA; ss; antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer; rhabdomyosarcoma; type 2 diabetes; cytostatic; antidiabetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New compounds, particularly antisense oligonucleotides, targeted to a
nucleic acid molecule encoding forkhead box OIA, useful for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human forkhead box OlA DNA antisense oligonucleotide target region

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (SHUT/)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (VENI/)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (LIND/)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (BHAN/)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RESULT 312
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ADN40747
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                 phosphorothicate linkage, at least one modified sugar molety, preferably a 2'-O-methoxyethyl sugar molety, or at least one modified nucleobase comprising a 5-methyloytosine. The antisense compounds are useful for modulating the expression of the human PIM-1 polypeptide and in preparation of a composition for treating hyperproliferative disorders, e.g. cancer. This sequence represents a human PIM-1 DNA antisense
                                                                                                                                                                                                                                                                                                                        The invention relates to a compound targeted to a nucleic acid molecule encoding the human PIM-1 polypeptide. The compound is an antisense oligonoucleotide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e.
                                                                                                                                                                                                                   New compound that modulates PIM-1 expression, useful in treating an animal having a disease or condition, i.e. hyperproliferative disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; PIM-1; ss; antisense oligonucleotide; phosphorothioate linkage;
2'-0-methoxyethyl sugar moiety; 5-methylcytosine;
hyperproliferative disorder; cancer; cytostatic.

#4

The invention relates to a compound targeted to a nucleic acid molecule encoding the human forkhead box OlA polypeptide. The compound is an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage is. a phosphorothicate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are

The invention relates to a compound targeted to a nucleic acid molecule encoding the human forkhead box OlA polypeptide. The compound is an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of the human forkhead box OlA hyperproliferative disorders, e.g. cancer, preferably rhabdomyosarcoma, and type 2 diabetes. This sequence represents an antisense control of coligonucleotide targeted to DNA encoding the human forkhead OlA 25-SEP-2003; 2003US-00671074. 26-SEP-2002; 2002US-00260203. cancer, or type 2 diabetes. phosphorothioate linkage; 2'-0-methoxyethyl sugar moiety;
5-methylcytosine; hyperproliferative disorder; cancer; rhabdomyosarcoma;
                          polypeptide and in preparation of a composition for treating hyperproliferative disorders, e.g. cancer, preferably rhabdomyosarcoma, and type 2 diabetes. This sequence represents a human forkhead OIA DNA antisense oligonucleotide target region of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a compound targeted to a nucleic acid molecule encoding a matrix metalloproteinase 11 (MMP11) polypeptide. The compound is an antisense oligonuclectide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonuclectide comprises at least one modified internucleoside linkage
                                                                                                                                        Rat; matrix metalloproteinase 11; MMP11; ss; antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer; cytostatic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   preparation of a composition for treating hyperproliferative disorders, e.g. cancer. This sequence represents a rat MMP11 DNA antisense oligonucleotide target region of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New oligonucleotide compound that inhibits expression of matrix metalloproteinase 11, useful for preparing a composition for treating hyperproliferative disorder, e.g., cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2.0-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of the MMPII polypeptide and in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The invention relates to a compound targeted to a nucleic acid molecule encoding a matrix metalloproteinase 11 (MMP11) polypeptide. The compound is an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of the MMP11 polypeptide and in preparation of a composition for treating hyperproliferative disorders, e.g. cancer. This sequence represents an antisense oligonucleotide targeted to DNA encoding the rat MMP11 polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human beta-site APP-cleaving enzyme 2 DNA antisense oligonucleotide #10.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; beta-site APP-cleaving enzyme 2; ss; antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methylcytosine; sporadic inclusion-body myositis; cancer; cytostatic.
                                                                                                                                             Rat; matrix metalloproteinase 11; MMP11; ss; antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer; cytostatic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New oligonucleotide compound that inhibits expression of matrix metalloproteinase 11, useful for preparing a composition for treating hyperproliferative disorder, e.g., cancer.
                                                                                                             Rat matrix metalloproteinase 11 DNA antisense oligonucleotide #5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0.9%; Score 15.4; DB 1; Length 20; 94.1%; Pred. encoding the human beta-site APP-cleaving enzyme 2 polypeptide. The compound is an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified nucleobase comprising a 5-methylcytosine. The antisense nucleobase comprising a 5-methylcytosine. The antisense APP-cleaving enzyme 2 polypeptide and for treating diseases associated with expression of beta-site APP-cleaving enzyme 2 such as sporciated with expression of seases associated with expression of seases associated with expression of seases associated and seases as special displayed the sease as special displayed and seases as special displayed and sease as sease as sease as sease as sease as a sease as a sease as sease as sease as a sease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antisense compound, useful for treating diseases associated with expression of beta-site amyloid precursor protein (APP)-cleaving enzyme 2 such as sporadic inclusion-body myositis and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                inclusion-body myositis and cancer. This sequence represents an antisense oligonuclectide targeted to DNA encoding the human beta-site APP-cleaving enzyme 2 polypeptide of the invention.
                                                                                                   /mod_base= OTHER

encoding the human beta-site APP-cleaving enzyme 2 polypeptide. The compound is an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably 2 2'-o-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methyloytosine. The antisense compounds are useful for modulating the expression of the human beta-site APP-cleaving enzyme 2 polypeptide and for treating diseases associated with expression of beta-site APP-cleaving enzyme 2 such as sporadic inclusion-body myositis and cancer. This sequence represents a human beta-site APP-cleaving enzyme 2 bNA antisense oligonucleotide target region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense compound, useful for treating diseases associated with expression of beta-site amyloid precursor protein (APP)-cleaving enzyme 2 such as sporadic inclusion-body myositis and cancer.
                                                                                                                                             /note= "OTHER= Phosphorothioate backbone. All cytidines are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a compound targeted to a nucleic acid molecule
phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methylcytosine; sporadic inclusion-body myositis; cancer; cytostatic.

Classifying patients with inflammatory disease, specifically asthma -according to polymorphisms in 5-lipoxygenase gene regulatory region, e.g. to identify candidates for lipoxygenase inhibitor treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence was used in the development of a novel method for classifying patients suffering from an inflammatory disease. The method comprises identifying in DNA from at least 1 patient a sequence polymorphism, as compared with the normal 5-lipoxygenase (5-DCX) gene (AAT88431), in a 5-LOX regalatory gene sequence. The method can be applied to subjects with asthma, ulcerative colitis, bronchitis, sinusitis, postriasis, allergic and non-allergic thinitis, lupus or rheumatoid arthritis. Specifically it can be used to diagnose asthma or susceptibility to disease, identify treatments suitable for individual patients or assess the likely success of treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Haematopoietic stem cell growth factor; SCGF; burst-promoting activity; BPA; granulocyte macrophage colony stimulating activity; gene therapy; GPA; haematopoietic cell disorder; bone marrow inhibition; human;

                                                                                                                                                                                                      This sequence is a primer for DNA encoding the human haematopoietic stem cell growth factor (SCGF) of the invention. The polypeptide of the invention is of mammalian origin and has haematopoietic stem cell growth factor SCGF activity, including burst-promoting activity (BPA) and granulocyte macrophage colony stimulating activity (GPA). The products can be used for treatment, diagnosis and analysis of haematopoietic cell disorders and bone marrow inhibition, e.g. by cytotoxic anticancer agents such as 5-fluorouracil. The products can also be used for amplification of haematopoietic cells in vitro, e.g. for use in marrow grafting and gene therapy by insertion of SCGF gene using a suitable therapeutic
                                                                                                                                           Haematopoietic stem cell growth factor – useful for, e.g. treatment and diagnosis of haematopoietic cell abnormalities and bone marrow
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; variant thrombospondin 1; variant thrombospondin 4; SNP; polymorphism; vascular disease; coronary artery disease; forensics; myocardial infarction; atherosclerosis; stroke; venous thromboembolism; pulmonary embolism; paternity test; ds.

The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin I and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New pO157 plasmid-specified polypeptide found in Escherichia coli and other enterohemorrhagic Escherichia coli, that binds to and cleaves Clesterase inhibitor, useful for diagnosing and treating colitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cl-esterase inhibitor; enterchaemorrhagic pathogen; antiinflammatory; colitis; antibacterial; antidiarrhoeic; PCR; primer; ss.

                        The present invention relates to novel pOI57 plasmid-specified proteins found in Escherichia coll EDI933 and other enterchaemorrhagic B. coli, designated StcB, that bind to and cleave Cl-esterase inhibitor. Sequences of the invention are useful for diagnosing, preventing or treating hamolytic uraemic syndrome or colitis in a subject infected with an enterchaemorrhagic pathogen expressing inhibitor protein. They are useful for testing a molecule for the ability to reduce proteolysis of Cl for testing a molecule for the ability to reduce proteolysis of Cl primer which is used for amplifying B. coli poli7y plasmid DNA encoding StCE protein. This primer is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Process to detect high concentrations of virus in blood plasma or serum, by restricting the sensitivity of PCR.

```
The present invention describes a method for treating, preventing or delaying neoplasm in a mammal. The method comprises administering an BrbB - 3 protein, a nucleic acid encoding an ErbB-3 protein, or their c functional fragments, where an immune response is generated against the neoplasm. ErbB-3 has cytostatic activity, and can be used in gene cherapy. The method is useful for treating, preventing or delaying or neoplasms (e.g. adrenal gland, anus, auditory nerve, bile ducts, bladder, bone, brain, breast, buccal, central nervous system, cervix, colon, ear, confometrium, ososphagus, eye, eyelids, fallopian tube, gastrointestinal tract, head and neck, heart, kidney, larymx, liver, lung, mandible, contact, head and neck, heart, kidney, larymx, nose, oral cavity, covary, pancreas, parotid gland, penis, pinna, pituitary, prostate gland, crectum, retina, salivary glands, skin, small intestine, spinal cord, stomach, testee, thyroid, tonail, uterha, uterus, vagina, cetomach, prostate, colon and lung cancer). The present sequence crepresents an oligonucleotide used in the construction of a plasmid cord, comprising ErbB-3, which is used in an example from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Use of an ErbB-3 protein, a nucleic acid encoding an ErbB-3 protein or their fragments, for treating, preventing or delaying neoplasms (e.g. urethra, uterus, vagina or vulva neoplasm) or cancers (e.g. breast, ovary or colon cancer).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

This invention describes a novel method for for detection of high viral concentrations in blood plasma or serum by restriction of PCR sensitivity through suboptimal nucleic acid extraction, amplification and detection conditions. The method described is used to detect high concentrations of Parvovirus in the blood plasma or serum of humans. The method detects Parvovirus DNA with a content in humans of greater than 106 to 107 genome

Example 1; Page 6; 8pp; German.

/*tag= a //note= "at least one (and preferably all) of the backbone subunits are composed of amide units, so that the oligomer consists of the nucleobases attached covalently to a polyamide backbone"

                                                                     Key
New oligo-nucleotide inhibits cytomegalovirus replication - by binding to a portion of cytomegalovirus RNA, for the diagnosis, prophylaxis and treatment of CMV diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AATI1971-84 are antisense oligonucleotides (ONS) against human cytomegalovirus (CMV) that displayed activities of at least 50 % of control (ISIS 2922 shown in AATI1961). It was found that up to 4 internal mismatches could be tolerated without loss of antiviral activity. Antisense ONS targeting CMV DNA or RNA coding for the IEI, IE2 or DNA polymerase proteins have been shown to be effective in therapy, prophylaxis and diagnosis of CMV infection. The ONS may be modified to reduce nuclease resistance and to increase their efficacy. Modifications include phosphorothioate backbones, alkyl and halogen substituted sugar moieties at the 2' position. (Updated on 25-MAR-2003 to correct PF

New oligomers are claimed which (A) have at least one peptide nucleic acid (PNA) subunit and (B) have a sequence hybridisable to AUG region, 5' untranslated region, intron/exon (I/E) junction or coding sequence of cytomegalovirus gene selected from DNA polymerase, IE1 and IE2, or hybridisable to the E, E2, E4, E5, E6, E7, L1 or L2 reading frames of a papillomavirus. The PNAs can be used to target RNA and single stranded DNA (ssDNA) to produce antisense-type gene regulation moieties. Hence they may be used therapeutically for modulating cytomegalovirus and to appillomavirus processes and also as diagnostics (e.g., as probes for specific mRNAs). PNA oligomers have high affinity for complementary in specific mRNAs). PNA oligomers have high affinity for complementary single stranded DNA. They are also able to form triple helices in which a first PNA strand binds with RNA or ssDNA and a second PNA strand binds with the resulting double helix or with the first PNA strand binds with the areal binds and are water soluble, which facilitates possess no significant charge and are water soluble, which facilitates cellular uptakes. Futher, since they contain amides of non-biological amino acids, they are biostable and resistant to ensymatic degradation by proteases. The present sequence targets CNV IE2 nuclear localisation

Example 27; Page 51; 155pp; English. maize or canola.

The present invention describes an enzymatic nucleic acid molecule (I) with RNA cleaving activity, which modulates the expression of a plant gene. Also described is a gene comprising a cDNA sequence encoding maize Delta-9 desaturase. (I) can be used (modulate expression of a gene, preferably Delta-9 desaturase or a granule bound starch synthase (GBSS) gene, in a plant (preferably a maize or canola plant). (I) can be used to modulate caffeine synthesis in a coffee plant, nicotine production in a tobacco plant, flower pigmentation in a rose, petunia, chrysanthemum or marigold plant or lignin production in a tobacco, aspen, poplar or pine

Optionally the oligonucleotide include at least one 2'-(2-methoxyethoxy) sugar modification or phosphorothioate internucleotide linkages. The oligonucleotides (AAX17861 are also used to inhibit CMV infections (by in vivo or in vitro contact with cells, tissues or body fluids), especially to treat or prevent CMV infections, particularly retinitis
                                                                                                                                                                                                                                                                                                                                                                                                 New antisense oligonucleotides that target cytomegalovirus nucleic acid particularly including 2-methoxyethoxy sugar modifications, especially for treating viral retinitis, with long-lasting retention in the retina.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

Anti-CMV oligonucleotide #5477. BP AAX17894 standard; DNA; 20 (first entry) 11-MAY-1999 AAX17894 RESULT 328 AAX17894/c

Antisense; oligonucleotide; immediate early; DNA polymerase; CMV; cytomegalovirus; inhibition; replication; sugar modification; phosphorothioate; infection; retinitis; ss.

Human herpesvirus 5. Synthetic

WO9845314-A1.

```
Identifying and characterizing cells by comparing the pattern of gene expression in a selected gene family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 4; Page 45; 102pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Genetic proximity, gene expression, cell characterisation, homeobox gene; genetic defect; reverse transcriptase polymerase chain reaction; RT-PCR, kinase gene; protein phosphatase; P450; steroid receptor; cadherin;
                                                                                                                                                                                                                                                                                                                                                                  Antisense oligonucleotides (AAX17861-X17924) are targeted to a nucleic acid (AAX17925-X17948) encoding IE (immediate early) 1 or 2, or DNA polymerase of cytomegalovirus (CMV) and are able to inhibit CMV replication. Optionally the oligonucleotides include at least one 2'-(2-methoxyethoxy) sugar modification or phosphorothioate internucleotide minkages. The oligonucleotides are used to inhibit CMV infections (by in vivo or in viro contact with cells, tissues or body fluids), especially to treat or prevent CMV infections, particularly retinitis
                                                                                                                                                                                                                                              New antisense oligonucleotides that target cytomegalovirus nucleic acid particularly including 2-methoxyethoxy sugar modifications, especially for treating viral retinitis, with long-lasting retention in the retina.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Identifying and characterizing cells by comparing the pattern of gene

The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in a selected gene family; and (c) calculating a compartive index using a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its genetic status, whether it carries a genetic defect, or whether it is cransformed. They can be used for detecting a selected genetic defect in an individual, e.g. a fetus. They can also be used for determining the cells capable of expressing an homeobox related desired containing cells capable of expressing an homeobox related desired containing cells capable of expressing an homeobox related desired containing the pattern of gene expression in a selected geneticmining the pattern of gene expression. The containing the pattern of genes, kinase genes, the protein phosphatase genes, page enzyments.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Genetic proximity, gene expression; cell characterisation; homeobox gene; genetic defect; reverse transcriptase polymerase chain reaction; RT-PCR; kinase gene; protein phosphatase; P450; steroid receptor; cadherin;

The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell the pattern of expression of genes in a selected gene family; and (c) calculating a profifted formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its genetic status, whether it carries a genetic defect, or whether it is cransformed. They can also be used for determining the individual, e.g. a fetua. They can also be used for defect of a selected treatment on a test cell. They can also be used for oftaining cells capable of expressing an homeobox related desired property. The method uses reverse transcriptase polymerase chain reaction (RT-PCR) for determining the pattern of gene expression in a selected gene family. Sequences AA217803-218342 represent primers that can be used in the RT-PCR reactions to determine the pattern of gene expression. The gene family can be selected from a set of homeobox genes, kinase genes, procession in the RT-PCR reactions of the pattern of genes, strong genes, procession in the protein phosphatase genes, p450 enzyme genes, steroid receptor

Vider B;

WPI; 1999-419113/35. P-PSDB; AAY14698 Identifying and characterizing cells by comparing the pattern of gene expression in a selected gene family.

Claim 4; Page 45; 102pp; English.

The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell

```
dely (b) determining in the first celling the second cell; (b) determining in the first celling the second cell; (b) determining in the first celling the second cell; (b) determining in the first celling and (c) calculating a conversion of genes in a selected gene family; and (c) calculating a conversion of a specified formula. The methods can be used for determining the origin of a cell, its genetic status, whether it carries a genetic defect, or whether it is can individual, e.g. a fetus. They can be used for determining the origin of a selected treatment on a test cell. They can also be used for effect of a selected treatment on a test cell. They can also be used for containing cells capable of expressing an homeobox related desired property. The method uses reverse transcriptase polymerase chain reaction (RT-PCR) for determining the pattern of gene expression in a selected gene family. Sequences AAZI7803-Z18342 represent primers that can be used in the RT-PCR reactions to determine the pattern of gene expression. The gene family can be selected from a set of homeobox genes, kinase genes, expression in the protein phosphatase genes, PASO enzyme genes, steroid receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PCR primers AAX86135-56 were used to amplify the penicillin G amidase gene Escherichia coli. The amplified fragment was used to construct the expression vector of the invention. This expression vector comprises the tac promoter, the groEL intergenic region of DNA and the start codon of the groEL gene. Expression of the groEL and/or groES proteins along with the expressed, heterologous protein of interest leads to stabilization of the expressed protein. The new vectors yield higher titers of expressed enzymes relative to prior art vectors such as T7 RNA polymerase-based pET vectors. Also, when constitutive promoters are used in the new vectors,
a second cell comprises: (a) obtaining the first cell and the second
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New high expression vector for Escherichia coli useful for expression of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            groESL gene; expression vector; tac promoter; groEL; intergenic region; cephalosporin amidase; penicillin G amidase; PCR primer; ss.

The antisense oligonucleotides are used to regulate G1/S phase transition, especially to inhibit growth of cancerous cells. The oligonucleotides can be administered in the form of a therapeutic composition to treat a mammal afflicted with a tumour associated with aberrant expression of CDK4,
an inducer is not required to trigger expression of the heterologous protein. This may decrease the cost of the production of the protein and simplifies the fermentation process. The new vectors are used to obtain high yields of heterologous proteins expressed in microbial host cells, especially Bscherichia coli. In particular, the new vectors are used to express the enzymes cephalosporin amidase or penicillin G amidase

The invention relates to an isolated porcine totipotent cell. A porcine pluripotent or totipotent cell (edc) or other totipotent cell with a porcine primordial germ cell (edc) or other totipotent cell with a porcine stem cell factor (pSCF). Cell lines produced are useful for the generation of transgenic pigs, and for xenotransplantation. They are also useful for studying cell differentiation and gene regulation during embryonic development. The use of totipotent or pluripotent cells, like embryonic stem (ES) cells, in a totipotent cell-embryo-injection-method enables specific gene alterations, which allow the study of specific gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ó
Production of pluripotent or totipotent porcine stem cell lines - by long -term culture of transfected murine STO feeder cells with a porcine stem cell factor, useful for, e.g. xenotransplantation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        FADD; human; antisense; inhibitor; Fas-associated death domain; primer;

                                                                                                                                                                                                                                                              This invention describes novel antisense oligonucleotides (OGNs) (1) 8-20 mucleotides in length that specifically Mybridize with and inhibit nucleic acids encoding human Fas-associated death domain (FADD), targeted to the 3' untranslated region (3'UTR). (1) can be used to treat animals, especially humans, suspected of having or being prone to a disease or condition associated with FADD expression. AAZ44746-Z44831 represent primers and probes used in the method of the invention
                                                                                                                                                                              Antisense oligonucleotides, useful for inhibiting human Fas-associated death domain (FADD) expression are targeted to the 3' untranslated region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Typing polymorphic genes, useful to assess the association of alleles with diseases and in disease diagnosis, uses a taxonomy based sequence analysis in which a typing tree based on distinguishing sequences is
                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

This invention relates to antisense compounds 8-30 mucleobases in length targeted to the 5'-untranslated region, translational start site, translational termination region or 3'-untranslated region of a nucleic a translational termination region or 3'-untranslated region of a nucleic acid encoding a p38 mitogen activated protein kinase (MAPK), where the antisense oligonucleotides inhibit the expression of MAPK. Sequences AAC79480 and AAC79501 represent human p88alpha MAPK and p38beta MAPK CDNA sequences. AAC79511 - AAC79500 and AAC79512 - AAC79512 and AAC79571 - AAC79580 represent human p38alpha antisense oligonucleotides, while AAC79502 - AAC79512 and AAC79571 - AAC79580 represent human p38alpha cDNA sequence AAC79523 and antisense oligonucleotides AAC79533 - AAC79531 sisolated from rat tissue. Murine p38beta MAPK CDNA is represented in AAC79537 and antisense oligonucleotides targeting the sequence are given in AAC79538 - AAC79552. The antisense oligonucleotides have antirheumatic; antiarthritic;
                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antisense oligonucleotide; p38 mitogen activated protein kinase; MAPK, antirheumatic; antiarthritic; immunosuppressive; cardiant; heart disease; antiinflammatory; autoimmune disease; rheumatoid arthritis; apoptosis;
                                         method
             The present invention provides a novel method for typing genes, particularly human leukocyte antigen (HLA) coding sequences. The method uses DNA sequences and a taxonomy-based sequence analysis method to assign alleles for HLA-DQB1 and HLA-DQB1. These alleles have been linked to diseases such as diabetes, IgA deficiency, multiple sclerosis, cancer, clinical and immunological manifestations of HIV infection, coeliac disease, idiopathic nephrotic syndrome, immune responses to parasite antigens, peophigus vulgaris, inflammatory bowel disease, rheumatoid arthritis, allergy and other inflammatory diseases
                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antisense compound targeted to p38 mitogen activated protein kinase inhibits protein kinase and is useful for diagnosing and treating inflammatory, autoimmune and heart disease.
                                                                                                                                                                                                                                                                                                                   ..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New immortalized non-tumorigenic human middle ear epithelial cell line useful for studying gene and protein expression in otitis media, and for identifying chemical and biological agents for treating otitis media.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a substantially pure cell line of immortalized non-tumorigenic human middle ear epithelial cells, which express an exogenous immortalizing gene. The cell line is useful for studying the molecular mechanisms involved in the pathogenesis that results in hearing disorders, e.g. hearing loss or otitis media. The clines are also useful for studying the normal cell shology of human middle ear epithelial cells. The cell lines can also be used as a screening tool for identifying agents that may be useful in therapy
                                                                                                    Immortal cell line; middle ear epithelial; hearing disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Score 15.2; DB 1; Length 20;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to the isolation of a canine Ob gene (obese gene) especially from beagle dogs. The gene is isolated from a dog DNA library using primers ABZ80676-ABZ80690. This sequene represents a PCR primer used to isolates the gene encoding the Ob protein. The invention also includes a vector comprising the DNA and a host cell transformed with the vector. The sequence is used for the large scale preparation of canine
immunosuppressive; cardiant and antiinflammatory activity. The antisense oligonucleotides are useful for inhibiting the expression of p38 MAPK in cells or tissues. The oligonucleotides are used for treating an animal with diseases such as inflammatory or autoimmune diseases e.g. rheumatoid arthitis, or heart disease. The oligonucleotides are also useful for inhibiting inflammation or apoptosis

The present sequence is a PCR primer which was used to amplify human can an example illustrating an invention relating to a method for obtaining non-laematopoietic lineage cells from haematopoietic progenitor cells (HPCs). The non-hematopoietic lineage cells are useful corrected. The non-hematopoietic lineage cells are useful in the therapeutic treatment of various pathological conditions such as tissue repair, tissue transplantation and tissue reimplementation. They are useful for treating neurodegenerative disorders such as Alzheimer's disease, multiple sclerosis and Parkinson's disease, and vascular disorders such as arteriosclerosis, coronary artery disease, acrtic disorders such as arteriosclerosis, coronary artery disease, acrtic can eurysm and arterial diseases of the lower extremittes. The cells may be used in the treatment of other diseases associated with early also be used to treat disorders of the skin, such as excema and they procholesterolesment and familial combined hyperlipidaemia. They may also be used to treat disorders of the skin, such as excema and transplanted mice. PCR specific for human globin was performed with brain and muscle cells of the transplanted and nontransplanted mice. A PCR product was detected only in the brain cells, indicating that the human cells were only present in the brain
                                                                                                                                                                                                                Producing non-hematopoietic lineage cells from hematopoietic progenitor cells for use in tissue repair, transplantation, involves culturing the progenitor cells under environment that promotes cell differentiation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human MEKK1; mitogen-activated protein kinase kinase l;
